# HydroMinder Model 5111

### THANK YOU FOR YOUR INTEREST IN OUR PRODUCTS

Hydro Systems manufactures quality chemical propor warnings and cautions.			
WEAR	protective clothing and eyewea		
ALWAYS	observe safety and handling in		
ALWAYS	direct discharge away from you		
ALWAYS	dispense cleaners and chemica		
	CAUTION when maintaining you		
KEEP	equipment clean for proper ope		
WEAR	protective clothing and eyewear		
	equipment or changing metering		
ALWAYS	re-assemble equipment according		
	screwed or latched into position		
ATTACH	only to tap water outlets (85 PSI		
Through proper care	and maintenance, this equipmer		

#### Installation:

- to properly operate the proportioner is 25 PSI (flowing).
- 3. Attach the end of the discharge tube with the clamp and flooding ring to the discharge barb on the eductor.
- the level of the eductor, or the proportioner will continue to siphon concentrate after it is turned "off".)
- 5. Select a metering tip (see next two sections) and push it into the suction stub on the eductor body.
- 6. Slide the open end of the suction tube over the suction stub.
- properly.

### Metering Tip Selection:

The final concentration of the dispensed liquid is related to both the size of the metering tip opening (orifice) and the viscosity of the liquid being siphoned. If product viscosity is noticeably greater than that of water, consult the procedure for Measurement of Concentration on the next page to achieve your desired water-to-product ratio. For water-thin products, use the chart below as a guideline. Because such factors as inlet water pressure and temperature can affect dilution ratios, the figures listed below are only approximate. Test the actual dilution you are achieving using the Measurement of Concentration procedure for best results. Two undrilled, clear tips are supplied for drilling sizes not listed.

Tip Color	Drill Size	Approx. Ratio @ 40 PSI, water-thin viscosity	Tip Color	Drill Size	Approx. Ratio @ 40 PSI, water-thin viscosity
No tip		3:1	Green	70	48:1
Gray	30	3.5:1	Orange	72	64:1
Black	40	4:1	Brown	74	72:1
Beige	50	8:1	Yellow	76	100:1
Red	55	16:1	Aqua	77	128:1
White	57	24:1	Purple	80	200:1
Blue	60	28:1	Pink	87	400:1
Tan	65	32:1

Rev.B 9/10

#### Package Contains:

- 1. Proportioner with U-clamp for mounting.
- 2. Float with chain.
- 3. Inlet tube 1/4" x 7' with weight and footvalve.
- 4. Discharge tube 2 ft.
- 5. Metering tip kit .
- 6. instruction sheet.

rtioners. Please use this equipment carefully and observe all

ling to instruction procedures. Be sure all components are firmly n.

SI maximum).

ent will serve your toughest cleaning jobs.

1. Mount the unit in a level position on the side of a reservoir. The U-clamp may be repositioned or removed as necessary. 2. Install a minimum  $\frac{1}{2}$ " ID water hose between the inlet threads and the water spigot. Minimum water pressure required

4. Insert the foot valve end of the suction tube into the concentrate container. (The level of the concentrate must be below

7. Adjust the bead chain length to position the float at the desired level of solution. To prevent foaming, be certain that the solution level will always be above the point of discharge. Be sure float mechanism is not hampered by water turbulence caused by discharging solution. It may be necessary to baffle the float from the discharge in order for the unit to work

#### **Measurement of Concentration:**

You can determine the dispensed water-to-product ratio for any metering tip size and product viscosity. All that is required is to operate the primed dispenser for a minute or so and note two things: the amount of dispensed water/product mixture, and the amount of concentrate used in preparation of the solution dispensed. The water-to-product ratio is then calculated as follows:

Dilution (X) = <u>Amount of Mixed Solution — Amount of Concentrate Drawn</u>

Amount of Concentrate Drawn

Dilution ratio, then, equals X parts water to one part concentrate (X:1). If the test does not yield the desired ratio, choose a different tip and repeat the test.

Alternative methods to this test are 1) pH (using litmus paper), and 2) titration. Contact your concentrate supplier for further information on these alternative methods and the materials required to perform them.

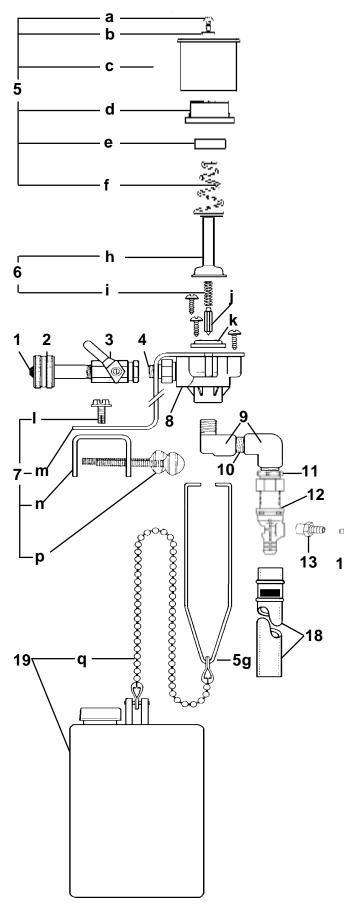

#### **Operation:**

Open the water supply ball valve. When the solution in the reservoir reaches the level set by the float, the valve will close. This will stop the water flow and siphoning of concentrate. When withdrawal of solution from the reservoir causes the level to drop more than 1-1/2 inches, the valve will open, and the reservoir will be refilled to the previous, pre-set level. This cycle will be repeated automatically until the supply of concentrate is depleted. The ball valve should be fully closed when changing metering tips or concentrate container, when reservoir is drained, or when the unit is not in use.

#### Troubleshooting:

Problem	n Prob	bable Cause	Remedy
1. Nodis	b. De		a. Open water inlet b. Replace assembly
			c. Install regulator if pressure exceeds 85 PSI
2. No cor draw	b. M		a. Clean or replace foot valve b. Clean* or replace
	c. Lo d. Di	ow water pressure	<ul> <li>c. Minimum 25 PSI flowing required</li> <li>d. Check position: Replace discharge tube if flooding ring is missing.</li> </ul>
3. Failure turn of		alve parts dirty or a	a. Clean or replace
			b. Replace c. Clean or replace
4. Backfl		iluted solution being a solution being	a. Replace or repair foot valve
	b. W		b. Replace eductor
soakir desca	ng the eductor in a de	scaling solution or by running	the eductor. This scale may be removed by g the descaling solution through the system. If the unit by educting water only before returning
